

# The UNNS Path Integral Protocol (UPIP): Sum-Over-Histories for Recursive Systems

UNNS Research Notes

September 25, 2025

## Abstract

We introduce the *UNNS Path Integral Protocol* (UPIP), extending the Quantization Protocol (UQP) into a full sum-over-histories formulation. Recursive sequences are treated as trajectories through nest space. Each trajectory contributes with a phase weight given by a recursive action functional. This formalism parallels Feynman’s path integral and opens a statistical and quantum view of recursion.

<b>6</b>	<b>Conclusion</b>	<b>3</b>

## 1 Recursive Trajectories

**Definition 1.1** (Recursive Trajectory). *A recursive trajectory  $\gamma$  is a sequence of nest states*

$$\gamma = (\mathcal{N}_0 \rightarrow \mathcal{N}_1 \rightarrow \cdots \rightarrow \mathcal{N}_T),$$

*generated by recursive update rules*

$$\mathcal{N}_{t+1} = f(\mathcal{N}_t, a_t).$$

**Remark 1.2.** *Each trajectory is a “history” of recursion, analogous to a path in mechanics.*

## 2 Recursive Action Functional

**Definition 2.1** (Recursive Action). *Given a recursion with coefficients  $a_t$ , define the action*

$$S[\gamma] = \sum_{t=0}^{T-1} L(\mathcal{N}_t, \mathcal{N}_{t+1}, a_t),$$

where  $L$  is a Lagrangian encoding recursive cost.

For linear recursions  $\mathcal{N}_{t+1} = a\mathcal{N}_t$ , take

$$L(\mathcal{N}_t, \mathcal{N}_{t+1}, a) = \frac{1}{2}(\mathcal{N}_{t+1} - a\mathcal{N}_t)^2.$$

## 3 Path Integral Formulation

**Definition 3.1** (Partition Function). *The UNNS path integral is*

$$Z = \sum_{\gamma} e^{iS[\gamma]},$$

summing over all admissible recursive trajectories  $\gamma$ .

**Definition 3.2** (Propagator). *The amplitude to evolve from  $\mathcal{N}_i$  to  $\mathcal{N}_f$  in time  $T$  is*

$$K(\mathcal{N}_f, T; \mathcal{N}_i, 0) = \sum_{\gamma: \mathcal{N}_i \rightarrow \mathcal{N}_f} e^{iS[\gamma]}.$$

**Theorem 3.3** (Stationary Phase Principle). *Dominant contributions to  $K$  arise from trajectories minimizing  $S[\gamma]$ , yielding recursive Euler–Lagrange equations*

$$\frac{\partial L}{\partial \mathcal{N}_t} - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{\mathcal{N}}_t} \right) = 0.$$

## 4 Diagrammatic Overview

## 5 Applications

### 5.1 Mathematics

- Defines recursive analogs of least-action principles.
- Provides generating functions via partition sums.

## 5.2 Physics

- Models recursion as discrete quantum field evolution.
- Suggests UNNS analogues of propagators and Green's functions.

## 5.3 Computation

- Enables probabilistic simulation of recursion.
- Suggests quantum-inspired algorithms for recursive search.

## 6 Conclusion

The UNNS Path Integral Protocol frames recursion as a sum-over-histories. Trajectories contribute phase-weighted amplitudes, and dominant histories satisfy recursive Euler–Lagrange principles. This positions UNNS as a bridge between recursion, physics, and computation.
